Scop si schema cu doua axe

Scopul este identificarea procedeului retoric pe care autorul il foloseste si si-l asuma, nu stabilirea intentiei de manipulare. Fiecare text are doua etichete independente. Axa structurii (gold_structure): niciuna, sau una dintre cele sase tehnici — aceasta este axa pe care se evalueaza clasificatorul. Axa utilizarii (gold_use): legitima, problematica, nedeterminabila sau nu se aplica — raportata descriptiv, nu scorata. O presupozitie poate avea aceeasi eticheta de structura in doua contexte, dar evaluari de utilizare diferite.

Cele sase tehnici (dupa Da San Martino et al., 2020, si pragmatica)

Presupozitie: o afirmatie contestata codificata ca deja data. Echivalenta fabricata: doua lucruri diferite afirmate ca identice. Falsa dilema: o alegere redusa la doua optiuni cand exista mai multe, sau prezentata ca inchisa in mod nejustificat. Whataboutism: o critica deviata aratand spre adversar. Intrebare retorica incarcata: o intrebare care isi afirma propriul raspuns. Cauzalitate implicita: cauzalitate dedusa din simpla succesiune sau coincidenta.

Reguli de constructie a unei perechi

Aceeasi tema; vocabular potrivit; exact un procedeu in membrul manipulativ; un control simplu care elimina procedeul fara a introduce altul; o motivatie scrisa de o propozitie. Procedeul se numara doar daca este asumat de autor: o comparatie negata, citata si contestata, sau atenuata NU se numara.

Cazuri ambigue si cum au fost decise

Numarul de optiuni la falsa dilema. Trei optiuni pot forma tot o alegere fals inchisa, iar doua pot fi legitime. Decizia nu se ia dupa numar, ci dupa inchiderea nejustificata a alternativelor. Controalele noastre cu trei optiuni deschise sunt etichetate niciuna.

> *Deschis (niciuna): “Putem construi fabrica, una mai mica, sau investi altundeva.”*
>
> *Fals inchis (falsa dilema): “Ori sustii proiectul, ori esti incompetent, ori urmaresti interese ascunse.”*

Presupozitie legitima vs problematica. Aceeasi structura, axa utilizarii difera. O premisa confirmata in context este legitima; o premisa contrazisa de text este problematica. Structura ramane presupozitie in ambele cazuri.

Legitima: “Fondul a avut lipsuri de trei ori anul acesta, cum confirma auditul; comitetul va discuta lipsurile.”

Problematica: “Desi agentia a respectat fiecare termen, evaluarea va aborda intarzierile ei repetate.”

Cadrul “so we...” (whataboutism vs cauzalitate). O propozitie de tip “ei ridica X, asa ca noi ridicam Y” are structura de deviere (whataboutism), dar conectorul cauzal poate fi citit si ca implicatie cauzala. Am etichetat dupa structura de deviere; notam ca este un caz de granita (ex. W04, W08 au fost citite de model drept cauzalitate implicita).

Panta alunecoasa. Afirmatii de tip “permite o exceptie si curand totul se prabuseste” au fost clasate drept cauzalitate implicita (cauzalitate dedusa dintr-o secventa escaladata); sunt la granita cu o categorie proprie de “slippery slope”.

Negatia relatiei de echivalare. O comparatie muta eticheta la niciuna doar cand negatia vizeaza relatia de echivalare insasi. O negatie care respinge comparatia dar pastreaza alta structura nu curata automat textul (vezi Q07, unde o comparatie afirmata a fost citita gresit ca negata).

Limita declarata (formulare pentru lucrare)

Seturile si etichetele de referinta au fost construite de autor. Evaluarea held-out utilizeaza exemple distincte de cele de dezvoltare, dar nu constituie validare independenta. Validarea cu adnotatori externi ramane o directie de lucru viitoare.

ENGLISH

Purpose and the two-axis scheme

The purpose is to identify the rhetorical device the author performs and endorses, not to establish an intent to manipulate. Each text carries two independent labels. The structure axis (gold_structure): none, or one of the six techniques — this is the axis the classifier is scored on. The use axis (gold_use): legitimate, problematic, undetermined, or not-applicable — reported descriptively, not scored. A presupposition can share the same structure label in two contexts while differing on use.

The six techniques (after Da San Martino et al., 2020, and pragmatics)

Presupposition: a contested claim encoded as already given. Manufactured equivalence: two unlike things asserted to be identical. False dilemma: a choice collapsed to two options when more exist, or unjustifiably presented as closed. Whataboutism: a criticism deflected by pointing at the opponent. Loaded rhetorical question: a question that asserts its own answer. Implied causation: causation inferred from mere sequence or co-occurrence.

Construction rules for a pair

Same topic; matched vocabulary; exactly one device in the manipulative member; a plain control that removes the device without adding another; a one-sentence written rationale. A device counts only if the author endorses it: a comparison that is negated, quoted and contested, or hedged does NOT count.

Ambiguous cases and how they were decided

Option count in false dilemma. Three options can still be a falsely closed choice, and two can be legitimate. The decision is not made by counting but by the unjustified closure of alternatives. Our controls with three open options are labelled none.

> *Open (none): "We could build the plant, a smaller one, or invest elsewhere."*
>
> *Falsely closed (false dilemma): "Either you back the project, or you are incompetent, or you have a hidden agenda."*

Legitimate vs problematic presupposition. Same structure, different use axis. A premise confirmed in context is legitimate; a premise the text contradicts is problematic. The structure remains presupposition in both.

> *Legitimate: "The fund fell short three times this year, as the audit confirms; the committee will review the shortfalls."*
>
> *Problematic: "Although the agency met every deadline, the review will address its repeated delays."*

The “so we…” frame (whataboutism vs causation). A sentence like “they raise X, so we raise Y” has a deflection structure (whataboutism), but the causal connective can also be read as implied causation. We labelled by the deflection structure and note it as a borderline case (e.g. W04, W08 were read by the model as implied causation).

Slippery slope. Statements like “allow one exception and soon everything collapses” were classed as implied causation (causation inferred from an escalated sequence); they sit at the border of a separate slippery-slope category.

Negation of the equivalence relation. A comparison moves to none only when the negation targets the equivalence relation itself. A negation that rejects the comparison but keeps another structure does not automatically clear the text (see Q07, where an affirmed comparison was misread as negated).

Declared limitation (wording for the paper)

The reference sets and labels were constructed by the author. The held-out evaluation uses examples distinct from the development data but does not constitute independent validation. Validation with external annotators remains a direction for future work.
